

JUSTICE THROUGH SCIENCE

*Bringing better science into criminal justice
through forensic education and public service.*

CRIMINAL JUSTICE NEEDS BETTER SCIENCE

DNA can be vital forensic evidence. A crime laboratory turns biological evidence into scientific data. But with mixed DNA from two or more people, labs often cannot transform their data into useful information. As a result, hundreds of thousands of evidence items are not fully used to pursue the guilty or free the innocent. Justice Through Science helps bridge this information gap.

FORENSIC EDUCATION

For better justice through science, trial lawyers and judges will introduce modern DNA evidence. Using computers, statistical scientists will unmix DNA mixtures and testify in court. Journalists will explain modern DNA science to their readers. Justice Through Science will provide forensic education for these professionals.

PUBLIC SERVICE

For better justice through science, scientists and their students will use computers to find useful information in unreported DNA. Lawyers and students will bring better DNA science into criminal cases. Justice Through Science programs will offer public services to enable this success.
